

Polielettronica®

Automatic Gluing machine for assembling photo albums

FB30DP

The FB30SP works with a special cold glue, almost odourless designed by Polielettronica, the glued page is completely insensitive to humidity. The 2 prints are glued back to back and the page realized keeps an high planarity in any environmental condition.

Excellent mechanical strength, the page feels pleasant, solid, resistant and flexible.

No thickness introduced by the gluing process, no cardboards or adhesive films.

Complete automatized procedure, variable length of the glued page in way to produce photo albums in different sizes. This gluing machine is particularly well suited for thin album paper.

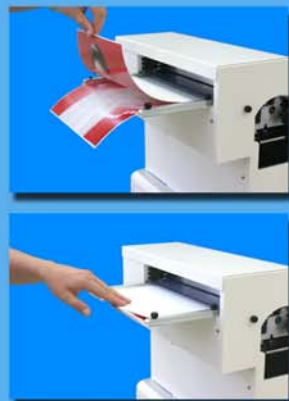

The prints, already creased and folded on their centre, are inserted into the gluing machine by respecting the pre-assigned sequence. Then the lower side of the page, just glued automatically, is placed over the last print inserted and so on while a photo book of some tens of pages is composed. A pressure roll placed over the carriage which collects the album provides to eliminate air bubbles.

Easy maintenance. Minimum amount of gluing material needed for each page. Very low cost for page.

This equipment is entirely designed and produced by Polielettronica.

1

Insert the page of the photo album. (previously creased)
The gluing machine will start automatically

2

The pages will be glued back to back, one on top of each other until the photo album is complete.

This brochure has been entirely realized with Polielettronica equipments
